Abstract not available for FR3014445 (A1)

Abstract of corresponding document: WO2015082392 (A1)

The invention concerns a facility for coupling a bioreactor (1) for culturing bio-organisms, in dynamic mode, with at least one device (2) for physicochemically analysing a fluid from this bioreactor or collecting samples of this fluid, the device (2) being equipped with a pump (20) and an injector (21), the bioreactor (1) being equipped with means (10) for supplying culture medium and xenobiotic(s). The facility is remarkable in that the bioreactor (1) is connected to a closed perfusion loop (11) provided with a pump (12), fitted with a

sampling loop (13) and in that the facility comprises: - a device for injecting a cleaning product (6) into said sampling loop (13), - two six-way valves (3, 4), the first valve (3) being connected to the closed perfusion loop (11), to the sampling loop (13) and to a cleaning loop (14), the second valve (4) being connected to the cleaning loop (14) and an injection loop (15) that connects the injector (21) to at least one of the devices (2).
